QuestionAnswer What are the main characteristics of the phylum Chordata that are studied in intermediate second year zoology? Phylum Chordata is characterized by the presence of a notochord, dorsal nerve cord, pharyngeal slits, endostyle, and post-anal tail at some stage in life. These features are studied to understand the structural and functional complexities of vertebrates and their evolutionary significance. Explain the process of digestion in Hydra as covered in intermediate zoology. Hydra exhibits extracellular and intracellular digestion. Food is captured via tentacles, ingested into the gastrovascular cavity where enzymes digest it extracellularly. Nutrients are then absorbed by cells lining the cavity, completing digestion and allowing for nutrient distribution throughout the body. What is the significance of the notochord in the development of chordates? The notochord provides axial support, serving as a primitive backbone during early development. It also plays a key role in the patterning of the surrounding tissues and influences the development of the vertebral column in vertebrates. Describe the reproductive methods observed in earthworms as discussed in intermediate zoology. Earthworms are hermaphroditic, possessing both male and female reproductive organs. They reproduce sexually through copulation, where two worms exchange sperm. Fertilization occurs externally, and cocoons containing fertilized eggs are deposited in soil. What are the main differences between oviparous and viviparous animals with examples? Oviparous animals lay eggs that develop outside the mother's body, such as birds and most reptiles. Viviparous animals give birth to live young that develop inside the mother's body, like mammals and some sharks. The main difference lies in the mode of development and egg laying versus live birth. Explain the concept of metamerism and its significance in annelids. Metamerism is the segmentation of the body into repeating units called metameres. In annelids, this segmentation allows for greater flexibility, mobility, and specialization of body regions, aiding in efficient movement and coordination. What are the major features of the class Insecta covered in intermediate zoology? Class Insecta is characterized by a three-part body (head, thorax, abdomen), six legs, compound eyes, antennae, and often wings. They undergo various types of development (complete or incomplete metamorphosis) and exhibit a high degree of adaptability and diversity.
