Each of these plays an essential role in processing information and maintaining bodily functions. The following sections will explore these structures in detail, providing the typical answers and their functional significance.

The Cerebrum: The Brain's Largest Structure

Answer Overview:

The cerebrum is the largest part of the sheep brain, characterized by its convoluted surface (gyri and sulci). It is divided into two hemispheres connected by the corpus callosum.

Deep Dive:

The cerebrum is responsible for higher-order functions such as sensory perception, voluntary movement, learning, and memory. In the dissection, students should identify:

In Exercise 32, the typical answer is:

The cerebrum is the prominent, rounded structure comprising the largest part of the brain, with the corpus callosum located beneath the cerebral cortex, connecting both hemispheres.

The Cerebellum: The Coordinator

Answer Overview:

Located posteriorly beneath the occipital lobe of the cerebrum, the cerebellum appears as a smaller, highly folded structure.

Deep Dive:

The cerebellum's role is in coordination, balance, and fine motor control. Dissection should reveal:

- The cerebellar cortex with its folia (folds).
- The arbor vitae: the white matter pattern visible within the cerebellum.
- The peduncles: fiber tracts connecting the cerebellum to the brainstem.

Typical answer:

The cerebellum is a distinct, smaller structure with numerous folds, situated under the posterior part of the cerebral hemispheres, responsible for coordinating movement and maintaining equilibrium.

The Brainstem: The Life Support System

Answer summary:

The brainstem is the central conduit for neural pathways, with distinct regions that manage essential involuntary functions vital for survival.

The Diencephalon: Thalamus and Hypothalamus

Answer Overview:

This region lies deep within the brain and includes the thalamus and hypothalamus, critical for sensory relay and homeostasis.

Deep Dive:

- The thalamus acts as a relay station, directing sensory signals to the cerebrum.
- The hypothalamus regulates homeostatic functions such as temperature, hunger, and hormone release.

Typical dissection answer:

The thalamus appears as paired, egg-shaped masses near the center of the brain, while the hypothalamus is situated below the thalamus, just above the pituitary gland.

The Pituitary Gland and Optic Chiasm

Answer Overview:

The pituitary gland, often called the master gland, is located at the base of the brain, beneath the hypothalamus. Adjacent to it lies the optic chiasm, where optic nerves cross.

Deep Dive:

- The pituitary is a small, pea-sized structure that secretes hormones influencing many body systems.
- The optic chiasm sits anterior to the pituitary and is involved in visual processing.

Answer summary:

In dissection, the pituitary appears as a rounded protrusion beneath the hypothalamus, with the optic chiasm positioned just anteriorly, where the optic nerves intersect.

Olfactory Bulbs and Cerebral Cortex

Answer Overview:

The olfactory bulbs are located at the anterior end of the brain, responsible for the sense of smell.

Deep Dive:
