Understanding Parabolas in Algebra 2

Before diving into graphing techniques and answer keys, it is crucial to understand what parabolas are and how they are represented algebraically.

Definition of a Parabola

A parabola is a symmetric, U-shaped curve that is the graph of a quadratic function. The general form of a quadratic function is:

$$f(x) = ax^2 + bx + c$$

where a , b , and c are constants, and $a \neq 0$.

Key Features of Parabolas

Understanding the key features helps in graphing and interpreting parabolas:

- **Vertex:** The highest or lowest point on the parabola, depending on the direction it opens.
- **Axis of symmetry:** A vertical line that passes through the vertex, dividing the parabola into two mirror images.
- **Direction of opening:** Upward if $a > 0$; downward if $a < 0$.
- **Y-intercept:** The point where the parabola crosses the y-axis, found by evaluating $f(0)$.
- **Roots or zeros:** The x-intercepts where the parabola crosses the x-axis, solutions of $f(x) = 0$.
